

Looks at the company site: <https://thecloudadvisory.com/>

As you see, the above site is missing a career page. So create a career page(html page with form) which will accept student information along with resume in text.

Career Page:

Full Name: text

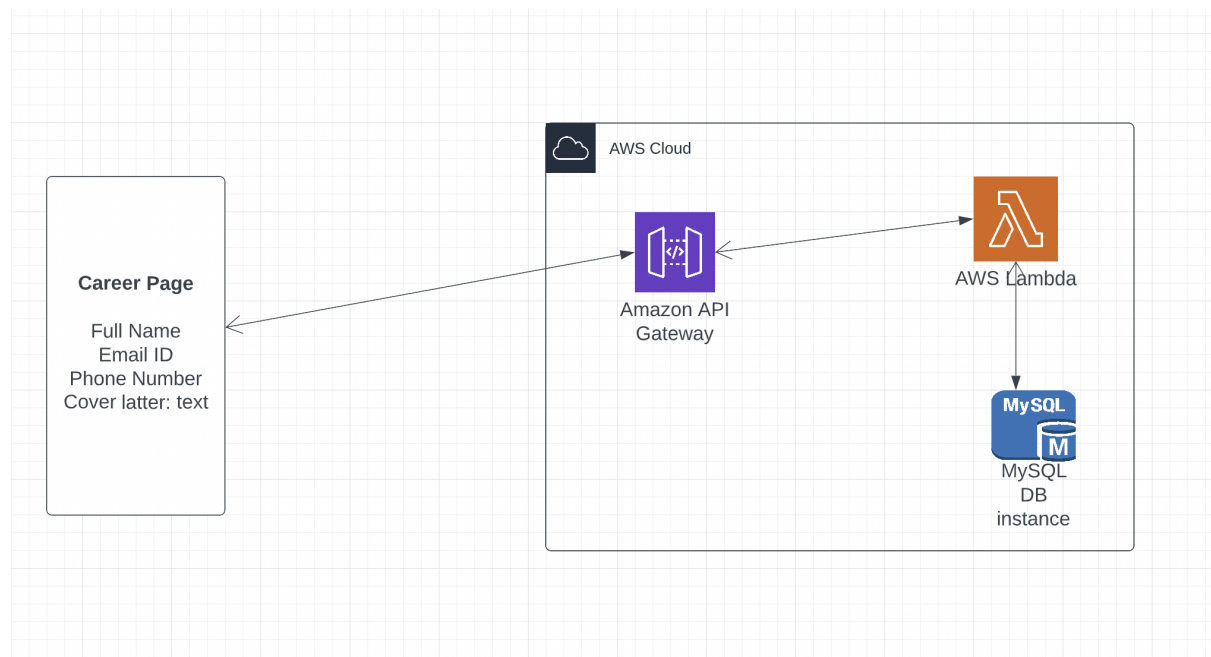

Email ID: Email id

Phone Number: Number

Cover latter: text

Once student will submit the above information. It will call the AWS API Gateway that will accept the above information and it will call the lambda function. Lambda function will extract the student information from the form and insert data into MySQL Database.

Below is the architecture:

Technology: Feel free to use any programming language for Lambda function.

How to submit the code: Create a github project and put your code, instruction, README to run the code.
